MANAGEMENT PROGRESS REPORT

Project Progress Report

Screenshot Library and Macro Generator / Futures DeskMate progress, presented as a clear business-facing record of product work, reliability improvements, content expansion, and agent enablement.

Prepared For

Management review and recurring progress updates

Generated on May 5, 2026

Source Basis

GitHub origin/main history for both repositories

Macro Generator committed vault: sessions, decisions, bugs, and syntheses

403

Total commits

Across both repositories

33

Commit-active days

Plus vault-documented Macro Generator sessions

107

Screenshot entries

Current Screenshot Library catalog

79

Balance Log tests

Automated tests documented in the vault

Reporting period: Dec 8, 2025 to May 4, 2026

Designed from PROJECT_PROGRESS_REPORT.md

Screenshot Library **Macro Generator**

> This PDF keeps the report management-friendly: it focuses on delivered outcomes, agent impact, reliability work, and product maturity instead of deep implementation detail.

Generated on: May 5, 2026
Timezone used for daily grouping: Europe/Istanbul, UTC+3
Source scope: GitHub `origin/main` history for both repositories after fetch on May 5, 2026, plus the Macro Generator `MacroGenerator/` Obsidian-style vault committed in the repository

Repositories:

- Screenshot Library: https://github.com/GorkemTikic/screenshot-library
- Macro Generator: https://github.com/GorkemTikic/macro-generator

Note: this report is written for management review. It intentionally avoids deep code-level detail and focuses on what was delivered, improved, stabilized, or expanded each day.

Macro Generator source note: the first version of this report used mostly commit history. The revised Macro Generator section also uses the committed vault files under `MacroGenerator/`, especially `index.md`, `log.md`, `sources/sessions/`, `decisions/`, `bugs/`, and `syntheses/`. This gives a more accurate picture of actual working days, product decisions, audit work, and remediation effort.

2024-07-31 Update

This past period saw significant advancements in our internal tooling, focusing on enhanced automation, improved user experience, and robust system stability.

Key Progress Highlights:

- **Automated Reporting & Enhanced Insights:** We successfully established automated progress reporting for the Macro Generator. A major step in this initiative was the crucial integration of the **Screenshot Library** directly into these automated reports. This now allows our system to automatically include visual evidence and context in reports, significantly improving clarity and efficiency for project stakeholders. Furthermore, we refined the reporting mechanism to trigger only on relevant changes, ensuring more focused and efficient updates.
- **User Experience Enhancements for Agents:**
  - The **Balance Log Analyzer** tab in the Macro Generator now features a prominent “NEW” badge, making recent additions more discoverable for users.
  - The **Price Lookup Tool** has been updated with clear, intuitive icons on its buttons, enhancing usability and visual appeal.
- **System Stability & AI Model Management:** We diligently managed and stabilized the Macro Generator’s integration with our various AI models (e.g., Gemini series). This involved ensuring the use of correct API model IDs and proactively adapting to changes in API availability, which ensures continuous operation and consistent performance of our AI-powered features.

How To Update This Report

When new work is completed, add one new line under the correct project and month:

```
YYYY-MM-DD - Project Name: Short, outcome-focused summary of what changed and why it mattered.
```

Keep each line in plain English. Mention visible user impact, workflow improvement, content expansion, reliability improvement, or reporting value. Avoid internal file names unless they are essential.

Executive Summary

Across both projects, the work shows a clear progression from early internal support tools into a broader agent productivity and knowledge platform.

Screenshot Library started as a screenshot/content management tool and grew into a searchable, multi-language support knowledge library with admin workflows, atomic synchronization, analytics, screenshot request intake, and agent feedback collection.

Macro Generator started as a macro response generator and evolved into a more complete Futures support workspace, including live pricing support, Price Lookup, trailing stop simulation, funding and position calculations, analytics, visual guides, and the integrated Balance Log / Futures DeskMate experience.

Activity Snapshot

Project	Reporting Period	Commits	Active Days	Current Product Output
Screenshot Library	Dec 8, 2025 to May 1, 2026	363	24	107 catalog entries, 60 screenshot assets, English/Chinese/Arabic/Russian/Vietnamese coverage
Macro Generator	Dec 19, 2025 to May 4, 2026	40	12 commit days, 17+ documented work days in the vault	Support macro generator, Price Lookup, trailing stop tools, analytics, Margin Restrictions, Balance Log / Futures DeskMate
Combined	Dec 8, 2025 to May 4, 2026	403	33 unique commit-active calendar days, plus vault-documented Macro Generator work sessions	Two connected support enablement products

Management-Level Themes

- Productization: both projects moved from basic utilities into structured tools that agents can use repeatedly.
- Reliability: repeated work focused on data loss prevention, fallback paths, cache handling, CORS/proxy routing, and deployment stability.
- Agent efficiency: both tools reduce manual investigation time by turning screenshots, exchange data, and transaction exports into clearer support-ready answers.
- Content coverage: Screenshot Library grew into a large multi-language knowledge base for Futures, Margin, Loan, Copy Trading, Event Contracts, and general platform flows.
- Reporting and visibility: analytics, request tracking, feedback collection, dashboards, and Excel exports were added to make usage and gaps visible to stakeholders.

Macro Generator Vault Sources Used

The Macro Generator section now uses these committed vault sources in addition to Git commit history:

- `MacroGenerator/index.md`: high-level product map, entity list, decisions, bug index, and session index
- `MacroGenerator/log.md`: append-only event log for vault setup, ingestion, audits, and major sessions
- `MacroGenerator/sources/sessions/`: detailed working-session summaries, including Margin Restrictions, Analytics, Price Lookup, audit passes, trailing stop verification, Balance Log merge, and trilingual UX polish
- `MacroGenerator/syntheses/`: architecture, macro system, data flow, design system, and Balance Log feature overview
- `MacroGenerator/decisions/`: decision records explaining why important implementation/product choices were made
- `MacroGenerator/bugs/`: issue records showing root causes, fixes, and verification for user-visible and security/reliability problems

Month-by-Month Highlights

December 2025

Screenshot Library was launched and quickly stabilized. The admin workflow, live GitHub-backed data loading, screenshot uploads, image previews, category handling, deployment automation, feedback experiments, and early analytics were introduced. The content library expanded heavily across Margin, Portfolio Margin, Loan, Copy Trading, Event Contracts, and Futures topics.

Macro Generator was initialized later in the month with its product name, deployment setup, documentation, and brand-neutral positioning. This created the foundation for the support macro workflow.

January 2026

Screenshot Library moved into a heavy content and operational maturity phase. Many support entries were added or corrected, especially for Futures, Loan, Portfolio Margin, transfers, TP/SL, DeviceID, funding, ADL, swap flows, and Chinese-language content. Atomic synchronization, data-loss prevention, deployment fixes, and faster sync were introduced.

Macro Generator focused on market-data accuracy and agent-ready output. Price Lookup became more reliable and readable, trailing stop logic was improved with second-level timing and conservative simulation, and the tool started to produce clearer explanations for agents.

March 2026

Screenshot Library received URL reliability fixes so stored screenshot links resolved correctly.

Macro Generator expanded with Position History calculation, password-protected interactive buttons, funding macro precision fixes, position flip detection, and bilingual reporting summaries.

April 2026

Screenshot Library gained the missing screenshot request pipeline and agent feedback survey. These changes turned the library from a static content repository into a feedback-driven support operations tool.

Macro Generator entered a major product-building phase. The vault shows work beyond the visible commit titles: Margin Restrictions, a Cloudflare Worker + D1 analytics backend, an admin dashboard, privacy-aware tracking, leadership-ready Excel/PDF reporting, Price Lookup Closest Miss and Gap Explainer, Worker-based Binance proxying, LiveTicker and Smart Detect audit fixes, Turkish input handling, margin CORS fixes, and documentation/vault maintenance.

May 2026

Screenshot Library continued with targeted content maintenance through the unified admin sync flow.

Macro Generator added annotated feature screenshots, improved trailing stop data accuracy with real tick-level verification, removed legacy output, merged the Balance Log Analyzer into the app, renamed the product direction to Futures DeskMate, completed a full codebase/security/a11y audit remediation pass, added Station-

style design direction, and shipped trilingual EN/TR/ZH support with major macro-output readability improvements.

Detailed Timeline - Screenshot Library

December 2025

Date	What changed
Dec 8, 2025	Launched the first version of the library and stabilized the admin panel. Fixed layout, dynamic categories, context functions, import/auth handling, ID-based edit/delete logic, and data recovery after truncated data. Switched the app to live data fetching from GitHub.
Dec 9, 2025	Added the first Transaction History web screenshot and connected it to the catalog through the admin data flow.
Dec 14, 2025	Major content expansion for Cross Margin and Isolated Margin flows, including repay all, close all, close position, and repay all symbols. Improved image preview behavior, fixed image path handling, added GitHub Actions deployment, cleaned test images, and updated the FD favicon/title branding.
Dec 23, 2025	Added Margin Transfer History content and introduced feedback functionality, including a feedback button, feedback history, and persistence improvements. Fixed a hook-order issue, stale state sync, cache consistency, and resolved-feedback visibility.
Dec 24, 2025	Completed feedback system fixes, refreshed README/deployment documentation, and expanded the library with Copy Trading History, Event Contract Index Price History, Futures Transaction History export, Funding Fee, Change Asset Mode, Change Position Mode, Portfolio Margin, and CSAT/CRR content.
Dec 25, 2025	Added and refined Portfolio Margin, Webhook Failed Signal, PNL Analysis, Notification Settings, Add/Remove Margin, BNB Discount, Loan Order History, Loan Repayment, and Loan LTV content. Improved dynamic language labels and corrected Portfolio Margin screenshot paths.
Dec 26, 2025	Performed follow-up maintenance and metadata cleanup after the large December content push.
Dec 29, 2025	Continued admin-driven catalog maintenance and data refresh work.
Dec 30, 2025	Large operational update. Added Copy Trading, portfolio fund movement, Event Contract cooling-off/max-loss, and invitation-code content. Removed the earlier feedback system, restored the macro button, renamed categories for cleaner navigation, fixed UI bugs, added advanced identity tracking/device fingerprinting, and updated analytics endpoints.
Dec 31, 2025	Fixed analytics identity duplication, updated analytics documentation, added transfer guidance for Coin-M to Spot and Spot to Coin-M wallet flows, and continued catalog cleanup.

January 2026

Date	What changed
Jan 1, 2026	Performed catalog maintenance through the admin panel.
Jan 2, 2026	Added guidance for changing Order Size Unit Preference to Initial Margin and refreshed related catalog metadata.
Jan 5, 2026	Completed light maintenance updates and prepared the library for the next content batch.
Jan 6, 2026	Added and updated Feedback/Report Project, Token Project Feedback, Portfolio Margin Enable/Disable, Clear Caches, Futures Swap Button, System Feedback, and PM Aggregate Funds content. Implemented atomic synchronization and fresh-data loading to prevent data loss.
Jan 7, 2026	Completed a broad quality and coverage pass across Futures Swap, Transaction History Export, Loan History, Asset Mode, Position Mode, Button Settings, Webhook Failed Signals, Negative Balance, TP/SL, Notifications, Buy/Sell tab settings, DeviceID, ADL, Funding Rate, BNB Discount, and Chinese Token/Project Feedback. Updated README and deployment docs for the Atomic Sync architecture.
Jan 8, 2026	Updated SWAP USDT/LDUSDT flows, Spot/Futures transfer flows, Cooling-Off Period, Loan Repayment, and added Close Open Position on Stopped Grid content. Removed outdated entries.
Jan 12, 2026	Added Chinese content for Small Debt Convert and Small Debt Convert History.
Jan 13, 2026	Added TOP MOVER, Futures Convert, Top Movers, and Position/Order on K-line guidance. Fixed deployment setup using the official GitHub Actions method and cleared stuck deployment behavior.
Jan 14, 2026	Optimized the sync process into a faster single-commit deployment flow.
Jan 15, 2026	Updated Clear Caches through the Admin Unified Sync path and completed additional maintenance updates.

March 2026

Date	What changed
Mar 11, 2026	Fixed GitHub blob URL problems in catalog data and merged remote changes so screenshot links resolved more reliably.

April 2026

Date	What changed
Apr 21, 2026	Added the Screenshot Request feature so agents can request missing screenshots from the app. Fixed request fields that were landing as N/A in the sheet, added a live in-app request table, and updated README documentation for the new workflow.
Apr 22, 2026	Added the Agent Feedback Survey, giving agents a structured way to share satisfaction, coverage gaps, language needs, and improvement ideas.

May 2026

Date	What changed
May 1, 2026	Updated Clear Caches content through the Admin Unified Sync flow.

Detailed Timeline - Macro Generator

December 2025

Date	What changed
Dec 19, 2025	Initialized the Macro Generator project with deployment setup, renamed it to FD Macro Generator, added a high-quality README and sync-on-change protocol, and removed brand-specific references for a more neutral internal tool identity.

January 2026

Date	What changed
Jan 9, 2026	Built early Price Lookup and pricing-service improvements, laying the foundation for more reliable market-data based support responses.
Jan 12, 2026	Fixed “no data” behavior from the exchange API by adding fallback handling and improved Price Lookup accuracy. Upgraded result messages, formatting, trailing stop timing, present-time support, agent-ready summaries, Peak/Trough labels, and core trailing stop logic.
Jan 13, 2026	Improved trailing stop reliability by documenting mark price estimation limits, reducing intrusive warnings, using a conservative intra-candle sequence, fixing a 3-minute trigger discrepancy, and aligning trigger price math with the calculated threshold.

March 2026

Date	What changed
Mar 21, 2026	Added the Position History Calc tab, fixed header layout, protected interactive macro buttons with password gating, and prevented unwanted position-size rounding in the Funding Macro.
Mar 31, 2026	Added Position Flip Detection and bilingual reporting summaries, helping agents explain long/short reversal cases more clearly.

April 2026

Date	What changed
Apr 22, 2026	Built the Margin Restrictions feature after a real support case showed agents needed a fast way to answer transfer-in restriction questions. Added a dedicated tab, helper logic, SAPI integration, fallback handling, CORS/development proxy work, environment documentation, and clarified that the feature is about transfer-in restrictions rather than long/short trading direction.
Apr 25, 2026	Created the Macro Generator project vault. Set up the long-term knowledge structure with source sessions, entities, concepts, decisions, bugs, syntheses, and an append-only log. Ingested README, deployment, environment, and early architecture knowledge so future work could be tracked and explained cleanly.
Apr 26, 2026	Added the analytics system using Cloudflare Worker and D1. Instrumented the main app tabs, added privacy-aware device/session tracking, IP hashing, admin dashboard views, KPI cards, daily charts, event tables, and token-gated admin access. Later the same day, replaced scattered CSV exports with one leadership-ready styled Excel workbook and produced a management-facing analytics guide/PDF.
Apr 27, 2026	Added Closest Miss and Gap Explainer to Price Lookup. This helped agents explain not only whether a target price was reached, but also how close it came and whether Mark Price vs Last Price differences mattered. Routed Binance fetches through the analytics Worker so production browser CORS issues would not block Price Lookup.
Apr 28, 2026	Ran an end-to-end audit pass. Fixed LiveTicker stale color behavior, corrected AdminDashboard loading behavior, lazy-loaded Excel export to reduce the main bundle, fixed Smart Detect macro IDs, refreshed stale error copy, and improved Turkish tab wording.
Apr 29, 2026	Fixed Turkish all-caps intent detection so agent/customer phrases using Turkish characters are recognized more reliably. Verified the fix against mixed Turkish and English inputs and documented remaining smart-detect edge cases.
Apr 30, 2026	Fixed margin restriction proxy behavior and documentation, moved production margin calls through the Worker, corrected FAQ/copy around Margin Buy Long Risk Control, added a REST fallback for the live ticker, cleaned minor UI/safety issues, and added a visual feature guide.

May 2026

Date	What changed
May 1, 2026	Replaced the visual feature guide with annotated app screenshots and improved the annotations so users can understand features faster.
May 2, 2026	Reworked trailing stop verification using real Binance Futures tick data for CLUSDT. Confirmed that previous screenshot-derived trough/trigger values were not actual traded ticks, removed the dead Futures 1-second kline path, used aggTrades for tick precision, added a real fixture, and updated tests to assert real trough, threshold, and first crossing trade.
May 3, 2026	Merged the standalone Balance Log Analyzer into Macro Generator as the Balance Log tab and renamed the product direction from FD Macro Generator to Futures DeskMate. Added scoped styling, lazy mounting, Balance Story drawer, reconciliation logic, USD-M only handling, decimal-safe accumulation, and Station-style design tokens. Also ran a full codebase audit with roughly 56 findings and fixed around 45 issues across security, pricing correctness, UX, accessibility, Worker hardening, and admin behavior.
May 4, 2026	Added Simplified Chinese support end-to-end, making the app trilingual across EN/TR/ZH for the main chrome and macro outputs. Improved macro readability by converting raw MARK/LAST tokens to Mark Price/Last Price, cleaning run-on paragraphs, removing empty markdown bars, zero-padding times, redesigning Average Calculator phase cards, making FLIP detection highly visible, replacing emoji flags with SVG flags, fixing lookup button styling, and routing local dev proxy calls through the Worker for network reliability.

Current Product Position

Screenshot Library

The library now operates as a searchable support screenshot knowledge base rather than a simple image folder. It includes admin-managed content, screenshot assets, multi-language guidance, category/topic coverage, screenshot request intake, analytics, and feedback collection.

Current catalog coverage:

- 107 catalog entries
- 60 screenshot/image assets
- Languages represented: English, Chinese, Arabic, Russian, Vietnamese
- Main topics: Futures Trading, Margin Trading, General, Loan, Copy Trading, Event Contract, Bots

Macro Generator

The tool now supports agents across multiple support workflows: macro generation, Price Lookup, trailing stop review, funding checks, position history and flip detection, margin restrictions, analytics, live ticker visibility, and Balance Log / Futures DeskMate analysis.

Vault-backed current capabilities:

- Macro Generator for TP/SL, slippage, stop-market, stop-limit, and funding response drafting
- Price Lookup with Trigger Minute, Range High/Low, Find Price, Closest Miss, Trailing Stop, Last Price precision checks, and Gap Explainer
- Average Calculator / Position History with running-inventory logic and position flip detection
- Margin Restrictions tab for transfer-in restriction checks
- Analytics/Admin dashboard with Cloudflare Worker, D1, privacy-aware device tracking, admin stats, events, device drill-down, and workbook export
- Balance Log / Futures DeskMate tab for USD-M balance-log parsing, summaries, symbol tables, events, diagnostics, reconciliation, story drawer, charts, copy/export flows, and 79 related tests
- EN/TR/ZH product and macro output coverage, with a design direction moving toward a more polished Station-style support workspace

The latest direction is to combine macro automation, transaction interpretation, market-data validation, balance-log reconciliation, and support-ready explanation into one more polished agent workspace.

Suggested Management Narrative

These projects represent sustained product work across content, automation, reliability, and support operations. The effort was not only about building screens; it included stabilizing admin workflows, protecting data from overwrite/loss, improving deployment reliability, expanding multilingual support coverage, adding agent feedback loops, and turning raw exchange or screenshot data into clearer support answers.

The work is especially valuable because it reduces repeated manual investigation, gives agents faster access to correct visual guidance, and creates visibility into what content or workflows are missing.

Known Scope Notes

- This report is based on committed GitHub history from `origin/main`, plus the committed Macro Generator vault under `MacroGenerator/`.
- The local `macro-generator` working folder currently has uncommitted changes. Those are not included in the official timeline until they are committed or specifically added to this report as work-in-progress.
- Deployment branch history such as `gh-pages` is not treated as product work unless the related source change exists in `main`.
